

Session S32 – Web Services Risk, Controls, and Audit Implications

By Ayan Roy

Topic Summary

Learn the basics of Web services, the risks, and security vulnerabilities associated with Web services. Securing Web services to mitigate the risks does not have to be a drawn-out, expensive process. Many organizations already have security architecture that can support secure Web services. They fail to realize that they can implement controls leveraging existing infrastructure and security components. The preventive and detective controls for Web services will be discussed in the session.
